

Prepare for even the Smallest Emergencies.

Check out the Pedi-Immobilizer™ on Page 132!

Improvised equipment, or scaled down versions of adult equipment, are not adequate because kids are not little adults. Their heads are larger in proportion to their bodies and the nature of their injuries is often different.

Every minute counts in an emergency call when a child is involved. Having the proper equipment to treat these small patients counts too.

“A UNIQUE ALTERNATIVE TO PEDIATRIC IMMOBILIZATION”

The **Pedi-Immobilizer™** is an extrication and immobilization device for infants and children that you can trust.

The **Pedi-Immobilizer™** was designed for the purpose of immobilizing infants and small children who have suffered potential cervical spine injuries.

The device can also be used for extrication of these small patients in hard to reach places, such as the floorboard of a vehicle, or a car seat. To move a patient from such an area, increased manipulation is often required. In a cramped area, use of an adult sized backboard becomes difficult if not impossible.

The **Pedi-Immobilizer™** offers a unique alternative to these awkward extrication situations and also assures sound immobilization.
